

Detection of Light: From the Ultraviolet to the Submillimeter

Detection of Light provides a comprehensive overview of the important approaches to photon detection from the ultraviolet to the submillimeter spectral regions. This expanded and fully updated second edition discusses recently introduced types of detector: superconducting tunnel junctions, hot electron bolometer mixers, and fully depleted CCDs. It also includes historically important devices such as photographic plates. Material from many disciplines is combined into a comprehensive and unified treatment of the detection of light, with emphasis on the underlying physical principles.
