**Measurement Systems: Theory and Applications** A signal as referred to in communication systems, signal processing, and electrical engineering is a function that conveys information. For example, in information theory, a signal is a codified message, that is, the sequence of symbols. Particularly in digital signal processing a digital signal is sometimes defined as a sequence of digital samples. **Digital Signal Processing for Measurement Systems: Theory and Applications** covers the theory and state-of-the-art applications, from the sampling to the processing.
