

# E = Mc2

Already climbing the bestseller lists-and garnering rave reviews this little masterpiece sheds brilliant light on the equation that changed the world. Bodanis begins by devoting chapters to each of the equations letters and symbols, introducing the science and scientists forming the backdrop to Einsteins discovery from Ole Roemers revelation that the speed of light could be measured to Michael Faradays pioneering work on energy fields. Having demystified the equation, Bodanis explains its science and brings it to life historically, making clear the astonishing array of discoveries and consequences it made possible. It would prove to be a beacon throughout the twentieth century, important to Ernest Rutherford, who discovered the structure of the atom, Enrico Fermi, who probed the nucleus, and Lise Meitner, who finally understood how atoms could be split wide open. And it has come to inform our daily lives, governing everything from the atomic bomb to a televisions cathode-ray tube to the carbon dating of prehistoric paintings.
