

Climbing The Gamma Factor Ladder. Volume 5.

This book is the fifth volume of a series on the mathematics of composition velocities as may be experienced by deep future spacecraft for which maximum interaction energy is desired relative to the background. Time dilation for crew cabins located more or less on the spacecraft construction portions which experience the conjectured velocity compositions are implied and are equal to the relativistic Lorentz transformation factors associated with the composite velocities. General relativistic time dilation is neglected in this volume suffice it to say that general relativistic effects would manifest for spacecraft having sufficient invariant mass. A total of 29 degrees of relativistic motion is considered in this volume. The details of the formulas have largely not been omitted to provide the reader with a sense of the complexity of the underlying mathematics and so that the entire formula may be converted to code by a language translation program where actual simulations may be computed from first principles. Color font is included for context.
