

Energy And Mass In Relativity Theory

Energy and Mass in Relativity Theory presents about 30 pedagogical papers published by the author over the last 20 years. They deal with concepts central to relativity theory: energy E , rest energy E_0 , momentum p , mass m , velocity v of particles of matter, including massless photons for which $v = c$. Other related subjects are also discussed. According to Einsteins equation $E_0 = mc^2$, a massive particle at rest contains rest energy which is partly liberated in the nuclear reactions in the stars and the Sun, as well as in nuclear reactors and bombs on the Earth. The mass entering Einsteins equation does not depend on velocity of a body. This concept of mass is used in the physics of elementary particles and is gradually prevailing in the modern physics textbooks.

This is the first book in which Einsteins equation is explicitly compared with its popular though not correct counterpart $E = mc^2$, according to which mass increases with velocity. The book will be of interest to researchers in theoretical, atomic and nuclear physics, to historians of science as well as to students and teachers interested in relativity theory. Contents: On the Photon Mass; The Concept of Mass; Vacua, Vacuum: Physics of Nothing; Gravitation, Photons, Clocks; Photons and Static Gravity; Triologue on the Number of Fundamental Constants; Fundamental Units: Physics and Metrology; Photons: History, Mass, Charge; The Impact of the Sakata Model; The Theory of Relativity and the Pythagorean Theorem; and other papers.
