The most used types of microscopes in nanoscience and nanotechnology. **How does Scanning Electron Microscopy work?** A scanning electron microscope (SEM) is a type of electron microscope that produces images of a sample by scanning the surface with a focused beam of electrons. The electrons interact with atoms in the sample, producing various signals that contain information about the samples surface topography and composition. **Applications of SEM** UEF SEM stands for scanning electron microscope. The SEM is a microscope that uses electrons instead of light to form an image. Since their development in the
