

# Starship Drive: Blueprints of a Working Stardrive Engine for a Mother Ship and Shuttle

Travel to distant star systems and attain relativistic velocity. Also included are blueprints for shuttle engines that can lift thousands of pounds off the ground, for vertical takeoff and landing... This extraordinary book represents an amazing leap forward in starship construction. Carlos Salas tells you how to build a starship engine using innovative technology that allows you to attain relativistic velocity. Salas shuttle engine design can lift thousands of pounds off the ground for vertical takeoff and landing, using the law of gyro, which makes it possible for the shuttle to achieve upward thrust with nearly 100% efficiency, and which makes possible a constant forward acceleration of 1 G or better. Accelerations of this speed and consistency can compress time to make interstellar travel possible. In principle and function, Salas patented mother ship is in a class by itself, using two counter-rotating flywheels that work to create aggregate direction of motion to propel the ship to the stars. This practical, inspirational, and fascinating work is a must for anyone interested in aerospace engineering, space travel, and jet engine technology. You could even build your own jet pack, hovercraft, or flying car!
