

U.S. Farm Income

According to USDA's Economic Research Service (ERS), national net farm income, a key indicator of U.S. farm well-being, is forecast at \$95.8 billion in 2014, down 27% from last year's record \$130.5 billion. The 2014 forecast would be the lowest since 2010, but would remain \$8 billion above the previous 10-year average. The forecast for lower net farm income and net cash income is primarily a result of the outlook for lower crop receipts and government payments. In contrast, livestock returns are forecast to be steady to slightly higher. The 2014 farm bill (Agricultural Act of 2014; P.L. 113-79) eliminated direct payments of nearly \$5 billion per year, while market prices for program crops, despite their plunge since late 2013, are expected to remain above trigger levels for price-contingent programs, thus keeping government program support at historically low levels in 2014. U.S. agricultural exports are forecast to grow in importance for the sector as expanding international economies are expected to lead to continued increases in demand for both higher-quality foods and greater variety of consumer choice in household diets. In addition to record net farm income, farm wealth is also projected to remain at record levels. Farm asset values, which reflect farm investors and lenders' expectations about long-term profitability of farm-sector investments, are expected to rise by 2.4% in 2014 to a record \$3,001 billion for a sixth consecutive year of gains. However, the outlook for much lower commodity prices in 2014 has slowed the previously rapid growth of farmland values. Farm debt is projected to rise by 2.3% in 2014, thus lowering the farm debt-to-asset ratio only slightly to 10.5%, its lowest level since 2007. At the farm-household level, average farm household incomes have surged ahead of average U.S. household incomes. In 2013 (the last year for which

comparable data were available), the average farm household income of \$108,844 was about 53% higher than the average U.S. household income of \$71,274. These data suggest a strong financial position heading into 2014 for the agricultural sector as a whole relative to the rest of the U.S. economy, but with substantial regional variation. Declining prices for most major program crops signal tougher times ahead. Eventual 2014 agricultural economic well-being will hinge greatly on the final crop harvests and harvest-time prices, as well as both domestic and international macroeconomic factors, including economic growth and consumer demand.
