

Optical Methods in Dynamics of Fluids and Solids: Proceedings of an International Symposium, held at the Institute of Thermomechanics Czechoslovak ... September 17-21, 1984 (IUTAM Symposia)

The General Assembly of the International Union of Theoretical and Applied Mechanics decided in Cambridge, United Kingdom, in 1982 to arrange the Symposium on Optical Methods in the Dynamics of Fluids and Solids. This decision was stimulated by the fact that optical diagnostic methods are a more and more important tool in experimental mechanics. In contrast to the foregoing Symposium in Poitiers, 1976, which was devoted exclusively to optical methods in the mechanics of solids, it was a fruitful idea to bring together during the present Symposium scientists engaged in optical methods in the dynamics of all phases. It was proposed by the International Scientific Committee of the Symposium that contributions in experimental fluid dynamics should deal with transition from laminar to turbulent flow, compressible fluid flow including high temperature flow, non-equilibrium phenomena in fluid dynamics and the interaction of fluid flow with solid boundaries and bodies. As regards the mechanics of solids, the contributions should deal with the application of optical methods in the wave propagation in shock loaded bodies, in phenomena connected with the fracture mechanism, in nonstationary Vibrations of elements and parts of systems and in nonstationary strains in structures. The International Scientific Committee preferred to avoid invited lectures and in cooperation with the National Committees of IUTAM called for contribution from individual countries.
